- 4 Bayesian and likelihood analysis of two proportions

two binomia proportions

Bayesian and likelihood analysis of tw proportions

Motivation

- Consider a randomized trial where 40 subjects were randomized (20 each) to two drugs with the same active ingredient but different expedients
- Consider counting the number of subjects with side effects for each drug

	Diac		
	Effects	None	total
Drug A	11	9	20
Drug B	5	15	20
Total	16	14	40

Comparing two binomia proportions

Bayesian and likelihood analysis of tw proportions

Hypothesis tests for binomial proportions

- Consider testing H_0 : $p = p_0$ for a binomial proportion
- The **score** test statistic

$$\frac{\hat{p}-p_0}{\sqrt{p_0(1-p_0)/n}}$$

follows a Z distribution for large n

• This test performs better than the Wald test

$$rac{\hat{p}-p_0}{\sqrt{\hat{p}(1-\hat{p})/r}}$$

Bayesian and likelihood analysis of tw proportions

Inverting the two intervals

Inverting the Wald test yields the Wald interval

$$\hat{p} \pm Z_{1-lpha/2} \sqrt{\hat{p}(1-\hat{p})/n}$$

Inverting the Score test yields the Score interval

$$\hat{p}\left(\frac{n}{n+Z_{1-\alpha/2}^2}\right) + \frac{1}{2}\left(\frac{Z_{1-\alpha/2}^2}{n+Z_{1-\alpha/2}^2}\right)$$

$$\pm Z_{1-lpha/2} \sqrt{rac{1}{n+Z_{1-lpha/2}^2}} \left[\hat{p}(1-\hat{p}) \left(rac{n}{n+Z_{1-lpha/2}^2}
ight) + rac{1}{4} \left(rac{Z_{1-lpha/2}^2}{n+Z_{1-lpha/2}^2}
ight)
ight]$$

• Plugging in $Z_{1-\alpha/2} = 2$ yields the Agresti/Coull interval

Bayesian and likelihood analysis of tw proportions

Example

- In our previous example consider testing whether or not Drug A's percentage of subjects with side effects is greater than 10%
- $H_0: p_A = .1 \text{ verus } H_A: p_A > .1$
- $\hat{p} = 11/20 = .55$
- Test Statistic

$$\frac{.55 - .1}{\sqrt{.1 \times .9/20}} = 6.7$$

• Reject, pvalue = $P(Z > 6.7) \approx 0$

Comparing two binomia proportions

Bayesian and likelihood analysis of tw proportions

Exact binomial tests

- Consider calculating an exact P-value
- What's the probability, under the null hypothesis, of getting evidence as extreme or more extreme than we obtained?

$$P(X_A \ge 11) = \sum_{x=11}^{20} {20 \choose x} .1^x \times .9^{20-x} \approx 0$$

- pbinom(10, 20, .1, lower.tail = FALSE)
- binom.test(11, 20, .1, alternative = "greater")

Comparing two binomia proportions

Bayesian and likelihood analysis of tw proportions

Notes on exact binomial tests

- This test, unlike the asymptotic ones, guarantees the Type I error rate is less than desired level; sometimes it is much less
- Inverting the exact binomial test yields an exact binomial interval for the true proprotion
- This interval (the Clopper/Pearson interval) has coverage greater than 95%, though can be very conservative
- For two sided tests, calculate the two one sided P-values and double the smaller

Comparing two binomial proportions

Bayesian and likelihood analysis of tw proportions

Comparing two binomials

- Consider now testing whether the proportion of side effects is the same in the two groups
- Let $X \sim \text{Binomial}(n_1, p_1)$ and $\hat{p}_1 = X/n_1$
- Let $Y \sim \text{Binomial}(n_2, p_2)$ and $\hat{p}_2 = Y/n_2$
- We also use the following notation:

$n_{11} = X$	$n_{12}=n_1-X$	$n_1 = n_{1+}$
$n_{21} = Y$	$n_{22}=n_2-Y$	$n_2 = n_{2+}$
n_{+1}	n_{+2}	

Comparing two proportions

- Consider testing $H_0: p_1 = p_2$
- Versus $H_1: p_1 \neq p_2$, $H_2: p_1 > p_2$, $H_3: p_1 < p_2$
- · The score test statstic for this null hypothesis is

$$TS = rac{\hat{p}_1 - \hat{p}_2}{\sqrt{\hat{p}(1-\hat{p})(rac{1}{n_1} + rac{1}{n_2})}}$$

where $\hat{p} = \frac{X+Y}{n_1+n_2}$ is the estimate of the common proportion under the null hypothesis

• This statistic is normally distributed for large n_1 and n_2 .

Comparing two binomial proportions

Bayesian and likelihood analysis of tw proportions

Continued

- This interval does not have a closed form inverse for creating a confidence interval (though the numerical interval obtained performs well)
- An alternate interval inverts the Wald test

$$TS = \frac{\hat{p}_1 - \hat{p}_2}{\sqrt{\frac{\hat{p}_1(1-\hat{p}_1)}{n_1} + \frac{\hat{p}_2(1-\hat{p}_2)}{n_2}}}$$

The resulting confidence interval is

$$\hat{p}_1 - \hat{p}_2 \pm Z_{1-\alpha/2} \sqrt{\frac{\hat{p}_1(1-\hat{p}_1)}{n_1} + \frac{\hat{p}_2(1-\hat{p}_2)}{n_2}}$$

Comparing two binomial proportions

Bayesian and likelihood analysis of tw proportions

Continued

- As in the one sample case, the Wald interval and test performs poorly relative to the score interval and test
- For testing, always use the score test
- For intervals, inverting the score test is hard and not offered in standard software
- A simple fix is the Agresti/Caffo interval which is obtained by calculating $\tilde{p}_1 = \frac{x+1}{n_1+2}$, $\tilde{n}_1 = n_1+2$, $\tilde{p}_2 = \frac{y+1}{n_2+2}$ and $\tilde{n}_2 = (n_2+2)$
- Using these, simply construct the Wald interval
- This interval does not approximate the score interval, but does perform better than the Wald interval

Brian Cafl

statistic

Exact tests

Comparing two binomial proportions

Bayesian and likelihood analysis of tw proportions • Test whether or not the proportion of side effects is the same for the two drugs

•
$$\hat{p}_A = .55$$
, $\hat{p}_B = 5/20 = .25$, $\hat{p} = 16/40 = .4$

Test statistic

$$\frac{.55 - .25}{\sqrt{.4 \times .6 \times (1/20 + 1/20)}} = 1.61$$

- Fail to reject H_0 at .05 level (compare with 1.96)
- P-value $P(|Z| \ge 1.61) = .11$

Bayesian and likelihood analysis of two proportions

Bayesian and likelihood inference for two binomial proportions

- Likelihood analysis requires the use of profile likelihoods, or some other technique and so we omit their discussion
- Consider putting independent Beta (α_1, β_1) and Beta (α_2, β_2) priors on p_1 and p_2 respectively
- Then the posterior is

$$\pi(\rho_1, \rho_2) \propto
ho_1^{ ext{x}+lpha_1-1} (1-
ho_1)^{n_1+eta_1-1} ext{ } ext{$ ext{$p}}_2^{ ext{$y}+lpha_2-1} (1-
ho_2)^{n_2+eta_2-1}$$

- Hence under this (potentially naive) prior, the posterior for p_1 and p_2 are independent betas
- The easiest way to explore this posterior is via Monte Carlo simulation
